

## S-5 Tank Bag Mounting Instructions

**Step 1.)** Remove the front strap from the bag and study the steering tube area of your bike.

**Step 2.)** Route the adjustable strap around the steering tube and under the front faring stay. Be sure to keep straps away from lines and wires.

**Step 3.)** Route the strap through its looped end so the strap encircles the mounting point.

**Step 4.)** Adjust the front strap to the desired length and attach the bag using the plastic clip.

**Step 5.)** Pull the bag rearward, so the front strap is snug, then press the suction cups firmly to clean and smooth surfaces on the fuel tank. Check the quality of the suction cup seals for air leaks.

**Step 6.)** The bag should be mounted squarely along the centerline of the fuel tank. Check the bag from time to time to ensure it remains secure. Deep scratches on the fuel tank surface can keep suction cups from functioning properly.
